for

for loops take an interator variable and assign it successive values from a sequence or vector. For loops are most commonly used for iterating over the elements of an object (list, vector, etc.)

```
for(i in 1:10) {
    print(i)
}
```

This loop takes the i variable and in each iteration of the loop gives it values 1, 2, 3, ..., 10, and then exits.

for

These three loops have the same behavior.

```
x <- c("a", "b", "c", "d")
for(i in 1:4) {
       print(x[i])
}
for(i in seq along(x)) {
       print(x[i])
}
for(letter in x) {
       print(letter)
}
for(i in 1:4) print(x[i])
```

Nested for loops

for loops can be nested.

Be careful with nesting though. Nesting beyond 2–3 levels is often very difficult to read/understand.
